

Madam Chair Landwehr and the House Committee on Human Services:

I am in support of HB2298. It was very alarming that the government was so willing to allow children to be vaccinated with a risky experimental vaccine. Children are generally safe with covid. They have mild to barely noticeable symptoms normally. All medical procedures have risk. This vaccine is an experimental medical procedure and has exhibited great risk for adults with over 23,000 deaths that are reported. We don't know the true number because only 1% of actual deaths and injuries are reported to VAERS.

If this vaccine is demonstrating risk and death for adults, what will it do to children? And WHY? This vaccine is all risk and no benefit to children. It should not be even recommended at all, and it most certainly should NEVER be mandated.

Yes, there are religious and medical exemptions available, but not all people do their homework. A mandated vaccine will most assuredly cause parents to line up who have not done their homework, but with their busy lives, will comply. They may not even make the connection to the vaccine when their child is diagnosed mysteriously with myocarditis or when their child collapses suddenly. Or has a potential host of serious ill effects.
